DOMINOS

The Atari "Domino Effect":
Higher earnings!
All new Dominos pits one or two players against one another in a head-to-head battle of wits and strategy.

Players control the direction of a simulated wall of dominos with a set of 4 instant-response push-buttons. Each player's wall starts out in one direction at opposite sides of the screen. The player progressively builds his wall by pushing the appropriate button (left, right, up or down) for the desired direction.

The speed of play increases as the action progresses, adding to the challenge.

A black domino set for one side, a white for the other reduces the possibility of a player watching the wrong wall.

The object is to trap your opponent into running into your wall or his own. Precise timing and planning your moves in advance are the keys to winning.

Dominos "fall" when opponent's wall is hit or player bumps into his own wall.

2 players can compete against each other. Or 1 player can challenge the computer.
The single player game plays just like the 2 player version, except the opponent is the computer, and it's programmed to counter strategy and trap the player if he makes a mistake.

Operator Options:
Number of points to win.
Total points to win per game is adjustable to 3, 4, 5, or 6, changing the overall length of the game.

Coinage.
Dominos can be adjusted to 1 or 2 coins per player or 2 plays per coin.

Exclusive self-test program.
As in all new Atari video games, highly reliable micro-processor logic allows a unique audio/visual options and self-diagnostic program to be built in. The program self-tests all micro-processor and memory functions. It also allows testing of all switch positions including 2 coin switches and all pushbutton control buttons.
The program also displays a readout of all game option switch code positions on the computer board.
